

Plugin HtmlÂ Feed

Use this [wiki plugin](#), introduced in [Tiki9](#), to show content from one Tiki-website on another Tiki-website. It could be used to prevent several versions of the same document on different sites. Useful for ex. for the same imprint on two related websites of the same project etc. With [HTML feed](#), you just need to maintain those documents on one place (website) and feed to one or several other website(s).

Parameters

Add an item to HTML Feed

*Introduced in Tiki 9. Required parameters are in **bold**.*

[Go to the source code](#)

Preferences required: feature_wiki, wikiplugin_htmlfeed, feature_htmlfeed

Parameters	Accepted Values	Description
name	text	Name of this feed

Default	Since
	9.0

Usage notes

- For traffic reasons HTMLFEED content is cached and after changing a feed's content (literally just a normal wiki pages content) - you need to clear caches of the sending website to update on the receiving sites.
- Only formatting wikiplugins like PluginFont and PluginSplit are supported, but not listing plugins, image or modules (for ex.: upcoming_events, img, trackerlist).

Examples

Syntax of the sending website

{HTMLFEED(name="SomeName")} Content {FONT(size="20")}some wikisyntax works{FONT} {SPLIT(colsize="5%|95%")}for
ex. Split and Font --- but not {img} {SPLIT} Content {HTMLFEED}

Syntax of the receiving site(s)

```
{HTMLFEEDLINK(feed="http://sendingdomain.com/tiki-feed.php?type=html" name="SomeName")} {HTMLFEEDLINK}
```
