n

Examples

Basic syntax

Insert a javascript file or/and some javascript code. {JS(file='file.js')}javascript code{JS}

The file.js file is in this case in the Tikiroot.

This will produce the following code for your Tiki site:

Note that it has to be surrounded by quotes.

```
{JS(file="http://example.org/tiki.js")}{JS}
```

{REMARKSBOX(title="Tip" type="tip")}Literal strings will have < , > , and & converted into HTML entities (and possibly other characters as well), so if your javascript is dealing with HTML (e.g. via `document.write()`), you probably need to convert them back.

Example 1

To include JavaScript code, use:

```
{JS()} var.... function ... ... {JS}
```

This will produce the following code for your Tiki:

```
var....  
function ...  
...
```

 Tip

The file is inserted before the param, if you need the reverse order use 2 calls to the JS plugin.

Example 2

This code:

```
{JS()}alert('coucou'){JS}
```

Would produce a pop up window that the user would have to click on "Accept" button ("D'accord" in this localized example) to make it disappear:
