

# PluginJS

Use the JS [wiki plugin](#), introduced in [Tiki3](#), to include JavaScript files or JavaScript code in a wiki page.

Alternatives: [PluginHTML](#) or [PluginJQ](#)

## Parameters

Add JavaScript code or files

*Introduced in Tiki 3.*

[Go to the source code](#)

*Preferences required:* `wikiplugin_js`

Parameters	Accepted Values	Description	Default	Since
(body of plugin)		JavaScript code		
<code>file</code>	url	JavaScript filename		3.0
<code>lateload</code>	(blank) y n	Late load, use headerlib		9.1

## Examples

### Basic syntax

---

Insert a javascript file or/and some javascript code. `{JS(file='file.js')}javascript code{JS}`

The `file.js` file is in this case in the Tikiroot.

This will produce the following code for your Tiki site:

```
<script type="text/javascript" src="file.js"></script>
```

Note that it has to be surrounded by quotes.

---

```
{JS(file="http://example.org/tiki.js")} {JS}
```

`{REMARKSBOX(title="Tip" type="tip")}` Literal strings will have `<`, `>`, and `&` converted into HTML entities (and possibly other characters as well), so if your javascript is dealing with HTML (e.g. via `document.write()`), you probably need to convert them back.

### Example 1

To include JavaScript code, use:

---

```
{JS()} var.... function ... ... {JS}
```

This will produce the following code for your Tiki:

```
<script type="text/javascript">
var....
function ...
```

```
...  
</script>
```

## Example 2

*This code:*

```
{JS()}alert('coucou'){JS}
```

Would produce a pop up window that the user would have to click on "Accept" button ("D'accord" in this localized example) to make it disappear:
