

# Plugin Profile

Introduced in *Tiki3*

Use this [wiki plugin](#) to add an install button for installing a profile. It allows a profile to be installed from anywhere, instead of only via the profile admin interface ( `tiki-admin.php?page=profiles` ).

Profiles are used to automate configuration of a site, turning on feature sets and permissions schemes and adding content. This way a site can be configured with a single click rather than 100s of clicks. See [profiles.tiki.org](http://profiles.tiki.org) for more information.

## Parameters

Add a button for applying a profile.

Introduced in *Tiki 3*. Required parameters are in **bold**.

[Go to the source code](#)

Preferences required: `wikiplugin_profile`

Parameters	Accepted Values	Description	Default	Since
<b>name</b>	text	Name of the profile to be applied.		3.0
<b>domain</b>	url	Profile repository domain. Default value is <code>profiles.tiki.org</code>	<code>profiles.tiki.org</code>	3.0

## Limitations

- It only installs the named profile, not its dependencies (if any)
- After applying the profile, it returns on the same page from which it was called (it means it ignores going to the Instructions page (if any))
- It doesn't have the edit plugin helper icon displayed (even if "Disable edit plugin icon (make plugin inline)" is not checked on `tiki-admin.php?page=textarea&cookietab=2`)

## Examples

This code:

```
{profile name="Personal_Blog_and_Profile"}
```

Would produce (screenshot):

A blue rectangular button with the word "Install" in white text.
