Plugin Regex

Use this wiki plugin to use a "regular expression" style search expression from another wiki page to search for and replace text in the body of the plugin (between the REGEX tags).

Parameters

Perform a regular expression search and replace

Introduced in Tiki 1. Required parameters are in **bold**.

Go to the source code

Preferences required: wikiplugin_regex

Parameters	Accepted Values
(body of plugin)	
pageName	

Description

Each line of content is evaluated separately

Name of page containing search and replace expressions separated by two colons. Example of syntax on that page: `/search pattern/::replacement text`

Default	Since
pageName	1

To use this plugin:

1. Place the search pattern (enclosed with forward slashes) and replacement text on a separate wiki page, separated by two colons (`::`). For example:
   `/search pattern/::replacement text`
2. Then enter that page name as the `pageName` parameter value of the plugin.
3. The text in the body of the plugin (between the `REGEX` tags) will be searched and each match of the search pattern will be replaced by the replacement text.

This plugin mimics the preg_replace PHP function. For advanced search patterns, see http://www.php.net/manual/en/reference.pcre.pattern.syntax.php in the online PHP manual or simply search the internet for "regular expression syntax".

Example

This code:

{REGEX(pageName="PluginRegex Example")}I had a horrible day.{REGEX}

Plus this syntax on a separate wiki page called PluginRegex Example:

`/horrible/::wonderful`

Would produce:

I had a wonderful day.
