

Selector Tracker Fields

User, Group, IP and Page selectors are [tracker field types](#) used in the [trackers](#) feature to link [items](#) to other objects or users. Sometimes these fields are automatically detected, such as a [user selector](#) detects the username of the person creating the tracker item.

Adding a name to a tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with [User Tracker](#), [registration tracker](#) or [Group tracker](#)

The page [Adding fields to a Tracker](#) explains how the fields, (columns or questions) of a tracker are set up.

Display behavior (checked only in tw>=1.10)

In the tracker list panel, the value of these fields will be displayed if the field has the option table visible and hidden/visible is checked for the user.

In the tracker item view panel, the value of these fields will be displayed if the hidden/visible is checked for the user.

In the tracker item edit panel, a tracker administrator (perm tiki_p_admin_trackers) will see each field with the pre-selected right value and will be able to change them. A non administrator will not see them.
