

See also [Shared Secrets](#)

As of 2014-07-29, this is a tool for developers only. You need to write code for the external system to access the information. See developer documentation at [User Encryption](#). The system is designed so that encryption can later be implemented for data in Tiki (files, tracker items, etc.)

Module Domain Password

This [Module](#) stores personal passwords for other domains securely in Tiki, as part of [User Encryption](#).

Usage

To use module **Domain Password** in a wiki page:

```
{module module="domain_password" domain="https://tiki.org" use_currentuser="y"
can_update="n" show_domain_prompt="y"}
```

where: Store personal passwords for other domains securely in Tiki

[Go to the source code](#)

Preferences required: feature_user_encryption

Parameters	Accepted Values	Description	Default	Since
<code>can_update</code>		If "y" the user can update the values, otherwise the display is read-only (y/n). Default: n		
<code>domain</code>		System the credentials apply for. The name must match a defined Password Domain		
<code>show_domain_prompt</code>		If "y" the word "domain" is shown before the domain. Otherwise the domain name takes the full row (y/n). Default: y		
<code>use_currentuser</code>		Use the currently logged-in user. The username is not editable. (y/n) Default: y
