Module specific to wikipages or structures or categories

Posted by [hetulk](#) Thu 20 Sep, 2007 06:44 GMT-0000 posts: 2

Hello,

At the moment, we have same modules appearing all over the site.

What i would like to see is that the module should be configurable so that they appear only on a particular wikipage or a group of wikipages as defined in structure or categories or maybe menu..

Lets say, i have a menu item

1 Home Page

1.1 about us

1.2 contact us

2 Services

2.1 Service one

2.2 service two

I would like to configure a module in such a way where i can specify that it should only appear on a wiki page (say only home page) then another module that should only appear on (about us and contact us page) and then another one for the services.

I am not sure how this could be done but i am guessing if someone could probably relate modules to Menus or Categories or structures a condition could be applied for module display...

anyone has a better idea, please share..

thanks

hk

Hi hk!

We solved a similar problem with modules.tpl modification. In order to display a different module for different URL's we modified the "../templates/module.tpl" template and enclosed the content of the template in an if clause:

```
{if $module_params.url eq $smarty.request.SERVER_NAME or !isset($module_params.url) }
```

```
.... CONTENT ....
```

```
{/if}
```

So we can pass a variable "url" with the domain name to the module.

For your case you could use

```
{if $module_params.page eq $smarty.get.page or !isset($smarty.get.page) }
```

```
.... CONTENT ....
```

```
{/if}
```

for the module template. After that, create modules for each site and pass the variable page=... to each new module.

Cheers,
Eduard
